FOREWORD

Why These Terms Matter

"I really wish someone had told me these terms — I would have built this company even better."

Every industry has a private vocabulary, and the startup world is no exception. Founders who don't yet speak that vocabulary end up learning it the hard way — in a board meeting where a "term sheet" clause quietly gives away control, or in a pitch where "unit economics" gets asked about and no one on the team can answer with a number.

This guide exists to close that gap in one sitting. It was assembled after a founder and content creator in the startup education space — known across Instagram for breaking down entrepreneurship in plain language, and the co-founder of a code-education venture and a "beyond the basics" learning platform — pointed out that there are roughly **45+ essential terms** that every founder should know cold before they start building. Rather than gatekeeping that knowledge, the idea was to write it all down, organise it properly, and add the context, data, and visuals needed to actually use it.

HOW THIS GUIDE IS ORGANISED

The chapters follow the natural lifecycle of a company: **legal foundation → product → metrics → scaling → business model → exit** — followed by a global/India comparison, a founder's roadmap, and a complete glossary you can use as a quick reference for the rest of your journey.

1 Read it once, end to end

Get the full mental model of how a startup is built, funded, and eventually exited — in order.

2 Keep it as a reference

Jump straight to the glossary or a specific chapter whenever a new term shows up in a meeting or deck.

3 Share it with your team

A shared vocabulary across co-founders and early employees prevents costly misunderstandings later.

A NOTE ON SCOPE

Startup terminology evolves quickly and varies by geography. This guide reflects widely-used definitions as of 2026, with a particular focus on the Indian startup ecosystem alongside global practice. Always validate legal and financial specifics with a qualified professional before acting on them.

CHAPTER 01

What Is a Startup, Really?

It isn't just "a new small business" — it's a specific kind of bet.

A startup is a young company built around a repeatable, scalable business model, designed to grow fast under conditions of extreme uncertainty. Unlike a traditional small business — a restaurant, a salon, a local shop — which usually copies a proven model at a modest, linear scale, a startup is searching for a model that doesn't fully exist yet, with the intent of growing it exponentially once found.

That distinction matters because it changes almost everything: how a startup is funded (equity investors betting on a big outcome, not a bank loan against steady cash flow), how it is measured (growth and learning velocity, not just quarterly profit), and how it is eventually valued (a multiple of future potential, not just current assets).

The Four Traits of a True Startup

STARTUP VS. SMALL BUSINESS

A neighbourhood bakery is a small business — a great one can be profitable and durable, but it isn't chasing 10x growth. A startup deliberately trades short-term efficiency for the chance at outsized, repeatable scale.

STARTUP VS. ENTERPRISE

An enterprise has already found its model and optimises execution. A startup is still searching for the model — which is why so much of this guide is about validation before scale.

CHAPTER 02

The Evolution of Startups

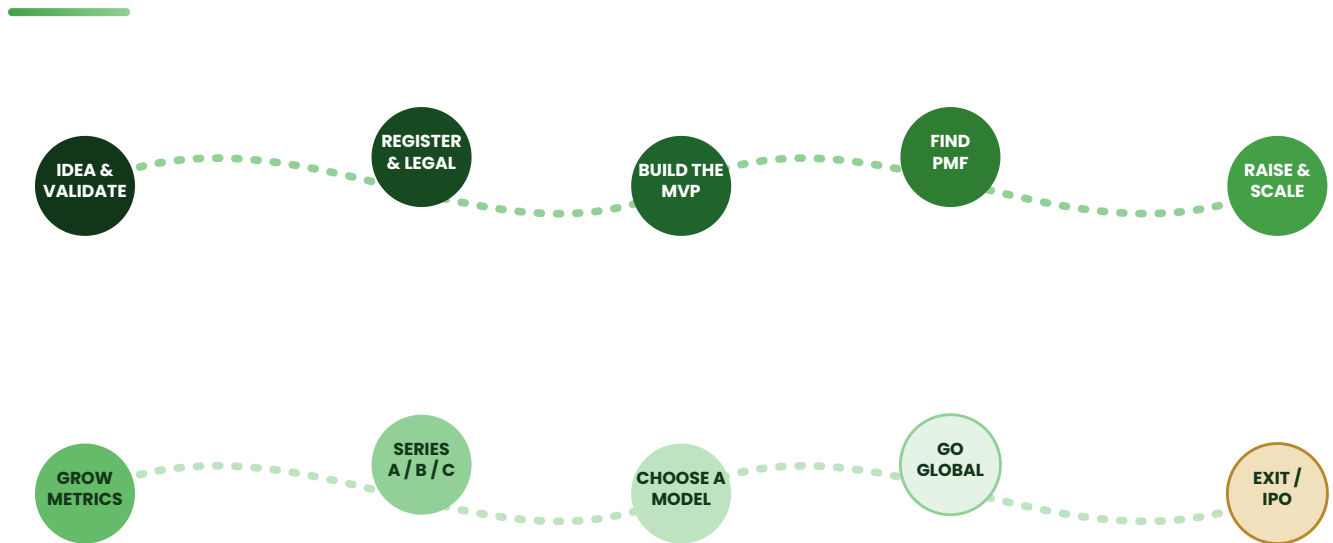

From garage workshops to AI-native companies built by teams of five.

- 1939 – 76**
 Garage-era beginnings: HP (1939), then Apple (1976) are founded in home garages, setting the "scrappy founder" archetype.
- 1994 – 98**
 The dot-com wave: Amazon, eBay and Google launch, proving the internet could carry entire business models, not just brock
- 2000 – 01**
 The dot-com crash wipes out thousands of over-funded, revenue-less startups – the first hard lesson in unit economics.
- 2004 – 08**
 Facebook, Airbnb and the App Store era begin – social platforms and marketplaces become the dominant startup archetyp
- 2008 – 14**
 Cloud computing and smartphones cut the cost of starting up dramatically; accelerators like Y Combinator scale the seed s
- 2015 – 20**
 India's startup boom accelerates – UPI, Jio-led mobile data access and the Startup India initiative (2016) fuel a new founder
- 2020 – 22**
 Pandemic-era digital acceleration and low interest rates drive a global funding boom – and, in India alone, roughly 45 new t
- 2023 – 26**
 A correction favours discipline over hype: AI-native, capital-efficient startups with real unit economics attract the strongest ir

CHAPTER 03

The Startup Journey, at a Glance

Every chapter that follows maps onto one stop on this road.

Real startups rarely move in a straight line — expect loops, pivots and detours between every stop above.

This guide's structure mirrors this journey:

Part I Foundation → Part II Product → Part III Metrics → Part IV Scaling → Part V Business Models & Exits
→ Part VI The Global Stage → Part VII Becoming a Founder → Glossary & Resources.

PART ONE

Foundation: Legal & Structure

Before you write a line of code or pitch a single investor, your company needs a legal skeleton to stand on. Get this part wrong and everything built on top of it — cap table, fundraising, even your ability to hire — becomes harder later.

- Choosing a business structure: Sole Proprietorship, Pvt Ltd, LLP, OPC
- MOA, AOA, DIN, Cap Table & Vesting
- GST, Trademark / IP & MSME Registration

CHAPTER 04

Choosing Your Business Structure

The first legal decision every founder makes — and one of the hardest to reverse cheaply.

Company registration and legal formalities are the very first checkpoint in a founder's journey. In India, four structures dominate early-stage registration, each with a different trade-off between simplicity, liability protection and the ability to raise external capital.

Structure	Liability	Compliance Load	Can Raise VC Funding?	Best For
Sole Proprietorship	Unlimited (personal)	Minimal	No	Solo freelancers, local services testing an idea
Private Limited Company	Limited to shares held	High (ROC filings, audits)	Yes — the standard choice	Venture-backed startups planning to raise equity
LLP (Limited Liability Partnership)	Limited	Moderate	Difficult (equity issuance is restricted)	Professional services, agencies, bootstrapped firms
One Person Company (OPC)	Limited	Moderate	Limited	Solo founders wanting limited liability without a co-founder

THE DEFAULT ANSWER

Most venture-track startups in India register as a **Private Limited Company** because it is the only structure most institutional investors will put a term sheet in front of — it supports clean equity issuance, ESOPs and a proper cap table from day one.

COMMON TERMS YOU'LL HEAR AT THIS STAGE

Tarata Sin / TAN (Tax Deduction Account Number) and **DIN** (Director Identification Number) are both mandatory registrations tied to your company's and directors' tax and legal identity respectively — required before you can operate formally.

CHAPTER 05

Legal Building Blocks Every Founder Signs

MOA — Memorandum of Association

The charter document defining what your company is legally allowed to do — its objectives, scope and boundaries.

AOA — Articles of Association

The internal rulebook: how directors are appointed, how shares transfer, how meetings are run.

DIN — Director Identification Number

A unique ID the government issues to anyone who wants to be a company director — required before incorporation.

Cap Table (Capitalisation Table)

The single source of truth for who owns what — founders, investors and employees — across every funding round.

Illustrative Cap Table — Seed Stage

Stakeholder	Shares	%
Founder A	4,500,000	45.0%
Founder B	3,500,000	35.0%
ESOP Pool	1,000,000	10.0%
Seed Investor	1,000,000	10.0%

A cap table is recalculated at every round as new shares are issued and existing holders get diluted.

Vesting: Why Equity Is Earned Over Time

Vesting protects the company if a co-founder or early employee leaves early. A standard schedule spans **4 years with a 1-year cliff**: nothing vests until month 12, then it vests gradually — often monthly — until year four.

Year 1 — CLIFF (0% until month 12)

Years 2 – 4 — vests monthly to 100%

Month 0

Month 48 (fully vested)

CHAPTER 06

Compliance & Protection

The registrations that keep you legal, tax-compliant and defensible.

GST Registration

Goods & Services Tax registration is mandatory once turnover crosses the prescribed threshold, or immediately for most online / interstate sellers. It lets you legally invoice customers and claim input tax credit.

Trademark & IP

Registering your brand name, logo and any proprietary technology protects your most valuable long-term assets — and becomes essential due-diligence material before any funding round.

MSME / Udyam Registration

A free government registration for small and medium enterprises that unlocks collateral-free loans, tax benefits, faster payment protection, and eligibility for government tenders.

SEQUENCING TIP

Most founders register the company first, apply for PAN/TAN and a bank account next, then layer on GST, MSME/Udyam and trademark filing as the business starts transacting — trying to do all of it on day one usually just creates avoidable delay.

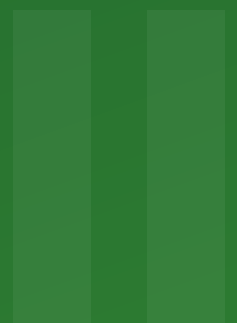

- ✓ Company incorporated with MOA & AOA filed
- ✓ Directors hold a valid DIN
- ✓ Cap table set up before any external cheque is accepted
- ✓ GST registration filed once liable
- ✓ Trademark application filed for brand name & logo
- ✓ MSME / Udyam registration completed

PART TWO

Building the Product

With the legal skeleton in place, the real work begins: building something people actually want, cheaply enough to survive being wrong a few times.

- Bootstrapping & the MVP
- Product–Market Fit & Dogfooding
- Pivot & the Cold Start Problem

CHAPTER 07

Bootstrapping & the MVP

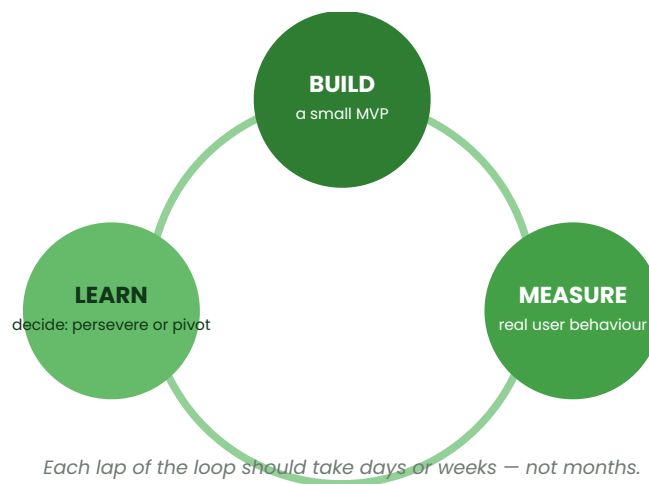

Bootstrapping

Funding the company from personal savings, early revenue or friends-and-family money — no external investors. It keeps full ownership and forces discipline, at the cost of slower growth.

MVP — Minimum Viable Product

The smallest version of your product that lets you test a real hypothesis with real users — not a shrunk version of the final vision, but a deliberately narrow test.

The Build-Measure-Learn Loop

WHY BOOTSTRAPPING AND THE MVP GO TOGETHER

With no outside capital cushion, a bootstrapped founder cannot afford to build a fully-featured product before learning whether anyone wants it. The MVP is what makes bootstrapping survivable — it turns "we think this works" into "we watched 50 people actually use it."

CHAPTER 08

Product–Market Fit & Dogfooding

Product–Market Fit (PMF)

The point where your product satisfies a strong market demand — usage, retention and word-of-mouth start compounding on their own, instead of requiring constant pushing.

Signals You've Reached PMF

- ✓ Users would be "very disappointed" without your product (a common survey benchmark: 40%+)
- ✓ Organic referrals and inbound demand start to outpace paid acquisition
- ✓ Retention curves flatten instead of decaying to zero
- ✓ Sales cycles shorten without discounting

Signals You Haven't

- ✗ Growth depends entirely on paid ads or founder hustle
- ✗ Users churn quickly after signing up
- ✗ Every sale needs heavy customisation or persuasion

Dogfooding

"Eating your own dog food" — using your own product internally, every day, exactly as a customer would. It surfaces bugs and friction faster than any external QA process, and keeps the team honestly close to the user experience.

PRACTICAL TIP

Set a rule that no feature ships until someone on the founding team has used it in a real workflow, not a demo — this single habit catches an outsized share of usability problems before customers ever see them.

CHAPTER 09

Pivot & the Cold Start Problem

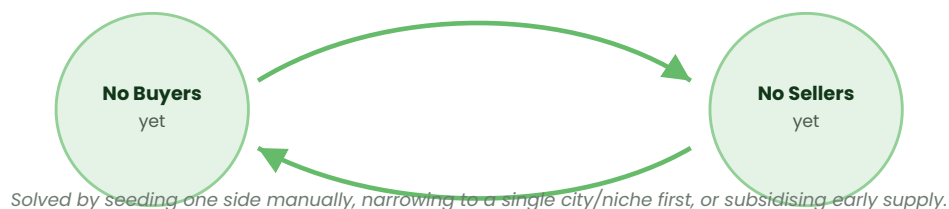

Pivot

A structured change in strategy — product, audience, or business model — made in response to evidence, while keeping what you've already learned. A pivot is a redirection, not a restart from zero.

Pivot Type	What Changes	Example Pattern
Zoom-in pivot	One feature becomes the whole product	A feature inside a broader app becomes a standalone tool
Customer-segment pivot	Same product, different buyer	A consumer tool is repositioned and sold to businesses instead
Platform pivot	From application to platform (or reverse)	A single app evolves into an API or marketplace others build on
Business-model pivot	How value is captured	Free-to-use shifts to a subscription or transaction-fee model

Cold Start Problem

The chicken-and-egg challenge many products face at launch — a marketplace with no buyers attracts no sellers, and vice versa; a social app with no friends already on it has nothing to offer a new user.

PART THREE

Metrics That Matter

Growth without the right numbers behind it is just noise. This part covers the handful of metrics that actually tell you whether a startup is healthy – and the ones that quietly hide trouble.

- Unit Economics, CAC & LTV
- Burn Rate, Runway & North Star Metric
- The Death Valley Curve & Company Moat

CHAPTER 10

Unit Economics, CAC & LTV

Unit Economics

The direct revenues and costs tied to a single unit of your business — one customer, one order, one subscription — stripped of shared overhead. If a business loses money on every unit, no amount of scale fixes that on its own.

CAC — Customer Acquisition Cost

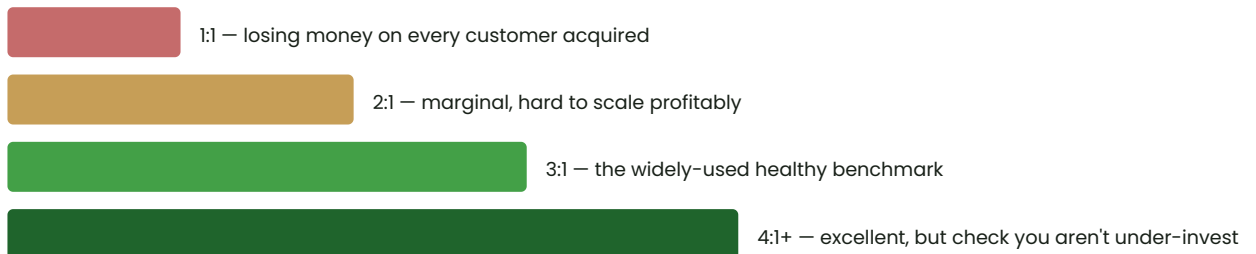

Total sales & marketing spend divided by the number of new customers it produced in that period.

LTV — Customer Lifetime Value

The total gross profit a business expects to earn from a customer over the entire relationship.

The Benchmark Investors Look For: LTV : CAC

LTV : CAC ratio

PAYBACK PERIOD

Alongside the ratio, investors also check the **CAC payback period** — how many months of gross profit it takes to recoup what was spent acquiring the customer. Under 12 months is generally considered strong for SaaS businesses.

CHAPTER 11

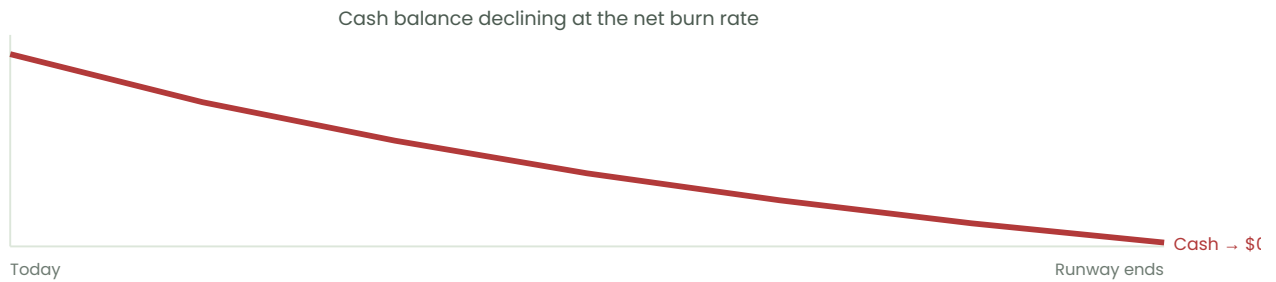

Burn Rate, Runway & the North Star

Burn Rate

How much cash the company spends, net of revenue, each month. "Gross burn" is total spend; "net burn" subtracts incoming revenue.

Runway

Cash in the bank divided by monthly net burn — literally, how many months remain before the company runs out of money.

North Star Metric

The single metric that best captures the core value your product delivers to customers — the one number the whole team rallies around (e.g. "weekly active households" for a grocery app).

Vanity Metrics

Numbers that look impressive but don't reliably predict business success — total downloads or page views, for instance, without any tie to retention or revenue.

RULE OF THUMB

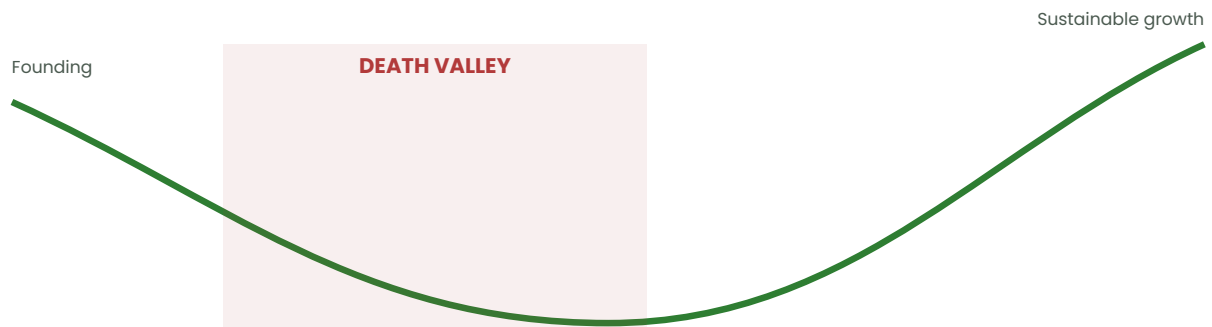

Most investors expect at least 12–18 months of runway after a funding round — enough time to hit the milestones needed for the next raise, with a safety margin.

CHAPTER 12

The Death Valley Curve & Company Moat

Death Valley (Curve)

The stretch after founding, and before meaningful revenue, when cash reserves are draining fastest and the risk of running out of runway is highest — visualised as a deep dip before the growth curve turns upward.

A "zombie startup" is one that survives this stretch indefinitely — neither dying nor growing — usually propped up by minimal, non-scaling revenue.

Company Moat

A durable, structural advantage that protects your business from competitors — the reason a well-funded rival can't simply copy you and win.

Network

PART FOUR

Scaling Up

Once the model is proven, the game changes entirely — from finding product-market fit to funding and executing aggressive, repeatable growth.

- 0 to 1 vs. 1 to N
- The Funding Journey: Pre-Seed to IPO
- Term Sheets, Due Diligence & Venture Debt
- Blitzscaling, Hockey Stick Growth & the Flywheel

CHAPTER 13

0 to 1 vs. 1 to N

Two completely different jobs, often done by the same founder.

0 to 1

Creating something that didn't exist before — a new product, category or approach. Success here is measured in learning and validation, not revenue scale.

1 to N

Taking a working, validated model and repeating it relentlessly — new cities, new segments, new channels — where success is measured in growth rate and operational efficiency.

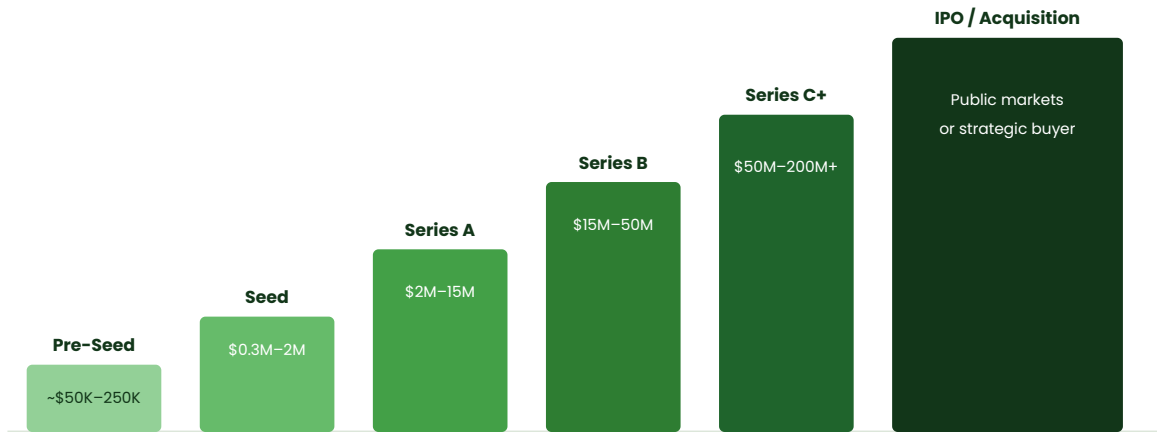

Dimension	0 to 1	1 to N
Core question	Does anyone want this?	How fast can we repeat what works?
Team shape	Small, generalist, founder-heavy	Specialised functions: sales, ops, growth
Biggest risk	Building the wrong thing	Scaling the wrong thing efficiently
Typical funding stage	Pre-seed / Seed	Series A and beyond

FOUNDER NOTE

Many capable 0-to-1 founders struggle in the 1-to-N phase, and vice versa — recognising which game you're playing right now shapes almost every hiring and process decision that follows.

CHAPTER 14

The Funding Journey: Pre-Seed to IPO

Typical ranges vary widely by sector, geography and market conditions — illustrative only.

Term Sheet

A non-binding document outlining the key terms of a proposed investment — valuation, board seats, liquidation preference — before lawyers draft the final agreements.

Due Diligence

The investor's deep verification process — financials, legal filings, customer contracts, cap table — before money actually changes hands.

CHAPTER 15

Venture Debt & Sweat Equity

Venture Debt

A loan designed for VC-backed startups, layered on top of an equity round, to extend runway without further diluting founders — typically repaid with interest plus small equity "warrants."

Sweat Equity

Ownership stake given to founders or early team members in exchange for time, effort and expertise rather than cash — recognising that unpaid early work has real value.

WHERE THESE FIT TOGETHER

A founder relying on sweat equity in year one might later use venture debt after a priced round — extending runway toward the next milestone without giving up more ownership than necessary.

Financing Options at a Glance

Instrument	Dilutive?	Repayment	Typical Use
Equity round	Yes	None — sold ownership	Core growth capital
Venture debt	Minimal (warrants)	Fixed schedule + interest	Extending runway between rounds
Convertible note / SAFE	Deferred	Converts to equity later	Fast, simple early-stage bridge
Sweat equity	Yes (from a founder pool)	None	Compensating early, unpaid contribution

CHAPTER 16

Blitzscaling, Hockey Stick Growth & the Flywheel

Blitzscaling

Prioritising speed of growth over efficiency, deliberately accepting waste and risk to win a market before competitors can — appropriate only in genuine winner-take-most markets.

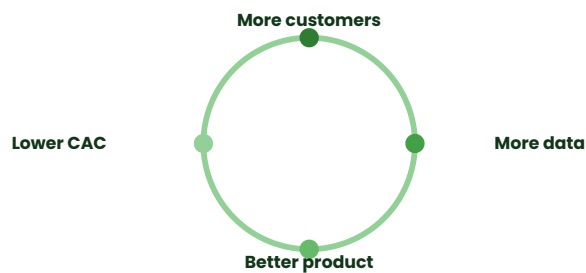

Hockey Stick Growth

A growth curve that stays nearly flat for a long stretch, then bends sharply upward — the shape investors hope every seed-stage bet eventually takes.

Flywheel Effect

A self-reinforcing loop where each part of the business makes the next part easier — more customers create more data, better data improves the product, a better product attracts more customers — building momentum that compounds over time.

PART FIVE

Business Models & Exits

Who you sell to shapes everything about how you build and grow. And every founder eventually has to plan for how — and whether — this ends.

— B2B vs. B2C vs. D2C

— Exit Strategies: Acqui-hire, IPO & Unicorns

CHAPTER 17

B2B vs. B2C vs. D2C

Model	Customer	Sales Cycle	Typical Metric Focus	Example Category
B2B (Business to Business)	Other companies	Longer, relationship-driven	Contract value, churn, expansion revenue	SaaS tools, enterprise software
B2C (Business to Consumer)	Individual consumers	Short, often impulse-driven	CAC, retention, order frequency	Apps, e-commerce, food delivery
D2C (Direct to Consumer)	Individual consumers, no middleman	Short to medium	Repeat purchase rate, brand loyalty	Owned-brand consumer goods

WHY THE CHOICE MATTERS EARLY

B2B startups usually need fewer, larger customers and can survive longer without brand marketing spend. B2C startups typically need volume, virality and much larger user bases before unit economics settle.

ACQUI-HIRE — A RELATED TERM

An **acqui-hire** is an acquisition made primarily to bring on a team's talent, not to continue running the acquired product — common when a startup has strong engineers but a business model that hasn't found its footing.

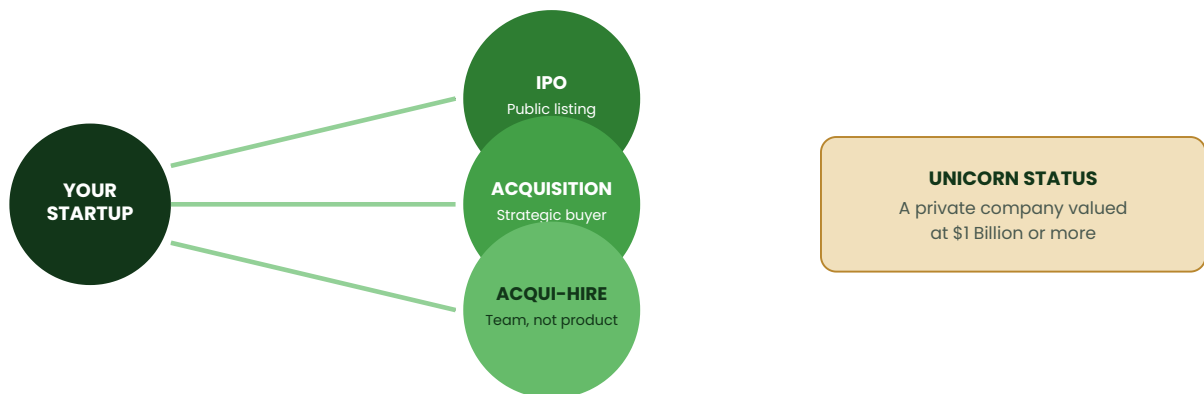

CHAPTER 18

Exit Strategies & Unicorns

Every founder should have a point of view on how this eventually ends.

Exit Strategy

The plan by which founders and investors eventually convert their equity into cash or liquid assets — decided early, since it quietly shapes fundraising, hiring and even product decisions along the way.

Whichever path a founder aims for, it should be chosen deliberately: an IPO demands years of consistent, transparent growth and heavy compliance; an acquisition needs a clear strategic fit for a buyer; an acqui-hire is often the honest, respectable outcome when the product didn't find its market but the team clearly can build.

PART SIX

The Global Stage

Startup ecosystems aren't uniform around the world. Understanding where India stands, and where global capital is concentrated, changes how founders think about fundraising, expansion and timing.

- India vs. Global Startup Ecosystems
- Global Startup Hubs, Ranked

CHAPTER 19

India vs. Global Startup Ecosystems

India is now the world's third-largest unicorn producer.

Unicorn Count by Country, Mid-2026

Approximate figures, mid-2026 — exact counts vary by tracker methodology.

700K+

STARTUPS REGISTERED IN INDIA

130+

INDIAN UNICORNS AS OF MID-2026

#3

INDIA'S GLOBAL RANK BY UNICORN COUNT

THE 2026 MOOD: DISCIPLINE OVER HYPE

After the record-setting boom of 2021 (roughly 45 new unicorns in a single year), 2026 has seen a much slower, steadier pace — investors are now prioritising demonstrated unit economics and genuine product-market fit over growth at any cost.

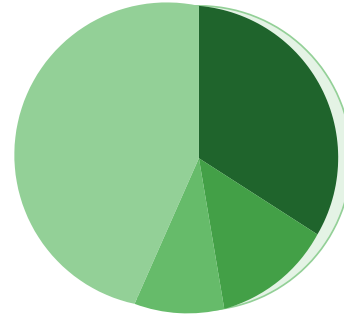

CHAPTER 20

Global Startup Hubs, Ranked

Top Global Startup Cities

#	City
1	Silicon Valley
2	New York City
3	London
—	Beijing, Shanghai, Bengaluru and Singapore all rank among the world's leading hubs

India's Unicorn Hubs

Bengaluru leads with 50+ unicorns

Bengaluru — 50+

Delhi NCR — 40+

Mumbai — 20+

Pune / Chennai — rising

COUNTRY RANKING

By overall ecosystem strength (not just unicorn count), the United States ranks first globally, with the United Kingdom, Israel and Singapore rounding out much of the rest of the global top five in most 2026 industry indices.

PART SEVEN

Becoming a Founder

Terminology only gets you so far. This final part turns the theory into a practical path – how to start, what a founder is actually responsible for, and the mistakes that trip up first-timers most often.

- How to Become a Startup Founder
- Responsibilities, Team & Leadership
- Common Mistakes First-Timers Make

CHAPTER 21

How to Become a Startup Founder

1

Self-assessment

Be honest about risk tolerance, runway (personal savings), and whether you can commit years, not months.

2

Find a real problem

Look for problems you personally feel, or that a specific, reachable group feels sharply and often.

3

Validate before building

Talk to 20–50 potential users before writing code. Look for people trying (and failing) to solve it themselves already.

4

Find the right co-founder(s)

Complementary skills, aligned values, and a shared appetite for risk matter more than friendship alone.

5

Build the MVP & register the company

Run both in parallel — legal formation (Part I) alongside your first testable product (Part II).

6

Get your first paying customers

Revenue — even small — is the strongest validation signal available, stronger than praise or press.

7

Raise capital only when it accelerates a proven model

Funding should pour fuel on a fire that's already burning — not attempt to light one that hasn't caught.

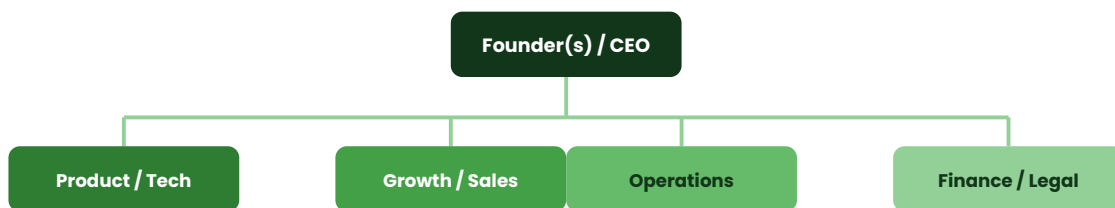

CHAPTER 22

Responsibilities, Team & Leadership

What a Founder Is Actually Responsible For

A Typical Early Team Structure

LEADERSHIP PRINCIPLE

In the earliest stages, leadership is less about delegation and more about clarity — a founder's most valuable output is often a decision made quickly and communicated clearly, not a task completed personally.

CHAPTER 23

Common Mistakes First-Time Founders Make

1 Skipping legal basics

Delaying registration, cap tables or IP filing until "there's traction" — by then, mistakes are expensive to unwind.

2 Building before validating

Spending months on a full product before confirming anyone urgently wants it.

3 Chasing vanity metrics

Optimising for downloads or press mentions instead of retention and revenue.

4 Hiring too fast

Growing headcount ahead of proven unit economics, burning runway on capacity no one needs yet.

5 Ignoring unit economics

Scaling a model that loses money per customer, assuming scale alone will fix it.

6 Founder conflict left unresolved

Avoiding hard conversations about equity, roles or vision until they explode later.

7 Raising too much, too early

Taking capital before it's needed, diluting ownership and inviting pressure to grow prematurely.

8 No clear North Star metric

Teams pulling in different directions because no single measure of value has been agreed on.

THE UNDERLYING THEME

Almost every mistake on this page comes down to one thing: moving faster than the evidence justifies. Speed matters — but only in service of a direction that's already been validated.

REFERENCE · A–Z

The Complete Glossary

45+ terms every founder should know cold — quick-reference edition (1 of 2).

Accelerator / Incubator

A fixed-term program offering mentorship, capital and network access in exchange for a small equity stake or fee.

Acqui-hire

An acquisition made mainly to bring on a team, not to keep running the acquired product.

Angel Investor

A wealthy individual investing their own money into early-stage startups, often before institutional VCs.

AOA — Articles of Association

The internal rulebook governing how a company is run day to day.

ARR / MRR

Annual / Monthly Recurring Revenue — the predictable, subscription-style revenue a business can count on.

B2B

Business-to-Business — selling your product or service to other companies.

B2C

Business-to-Consumer — selling directly to individual end users.

Blitzscaling

Prioritising speed of growth over efficiency to win a winner-take-most market.

Bootstrapping

Growing a company using personal funds or revenue, without external investment.

Burn Rate

The rate at which a company spends cash, net of revenue, each month.

Cap Table

The master record of who owns what percentage of a company, across every round.

CAC

Customer Acquisition Cost — total spend to acquire one paying customer.

Churn Rate

The percentage of customers who stop using a product over a given period.

Cold Start Problem

The chicken-and-egg challenge of launching a product that needs both supply and demand at once.

Startup Unlocked

Company Moat

A durable, structural advantage that protects a business from competitors.

D2C

Direct-to-Consumer — selling your own branded product straight to customers, skipping retailers.

Death Valley

The high-risk stretch after founding and before meaningful, sustainable revenue.

DIN — Director Identification Number

A unique government-issued ID required for anyone acting as a company director.

Dogfooding

Using your own product internally, exactly as a real customer would.

Due Diligence

An investor's thorough verification of a company's finances, legal standing and claims before investing.

ESOP

Employee Stock Ownership Plan — a pool of equity reserved to incentivise and retain employees.

Exit Strategy

The founders' and investors' plan to eventually convert equity into cash.

Flywheel Effect

A self-reinforcing loop where growth in one area compounds into growth elsewhere.

GST

Goods & Services Tax — India's indirect tax on the supply of goods and services.

Hockey Stick Growth

A growth curve that stays flat for a long period, then bends sharply upward.

IPO

Initial Public Offering — a company's first sale of shares to the public markets.

LLP

Limited Liability Partnership — a business structure combining partnership flexibility with limited liability.

REFERENCE • A–Z

The Complete Glossary

45+ terms every founder should know cold — quick-reference edition (2 of 2).

LTV

Lifetime Value — total gross profit expected from a customer over the relationship.

MOA — Memorandum of Association

The charter document defining a company's legal objectives and scope.

MSME / Udyam Registration

Government registration unlocking loans, tax and tender benefits for small businesses.

MVP

Minimum Viable Product — the smallest version of a product that tests a real hypothesis.

North Star Metric

The single metric that best captures the core value delivered to customers.

OPC

One Person Company — a limited-liability structure for solo founders.

Pivot

A structured change in strategy made in response to evidence, keeping prior learning intact.

Private Limited Company

A limited-liability structure that is the standard choice for venture-backed startups.

Product–Market Fit

The point where a product satisfies strong market demand and growth becomes self-sustaining.

Runway

The number of months a company can operate before its cash reaches zero.

SAFE / Convertible Note

A simple early-stage financing instrument that converts into equity at a future round.

Seed Funding

The first significant round of external capital, typically used to build and validate the product.

Series A / B / C

Successive funding rounds, each raised at a higher valuation to fund proven growth.

Sole Proprietorship

The simplest business structure, with unlimited personal liability.

Sweat Equity

Ownership given in exchange for effort and expertise rather than cash.

Term Sheet

A non-binding outline of the key terms of a proposed investment.

Trademark / IP

Legal protection for a company's brand, inventions and proprietary technology.

Unicorn

A privately held startup valued at \$1 billion or more.

Unit Economics

The direct revenue and cost of a single unit of the business, stripped of overhead.

Vanity Metrics

Numbers that look impressive but don't reliably predict business success.

Venture Capital (VC)

Institutional capital invested into high-growth startups in exchange for equity.

Venture Debt

A loan for VC-backed startups that extends runway without heavy further dilution.

Vesting

Earning equity gradually over time, typically with a one-year cliff.

Zombie Startup

A company that survives indefinitely without meaningfully growing or dying.

0 to 1

Creating something genuinely new, measured by learning rather than scale.

1 to N

Repeating a validated model relentlessly to grow it at scale.
